

Aronia Viking

Plant in full sun to partial shade. Adaptable to a wide range of soils but moist, fertile well-drained soil is best. When potted, plant at the same depth it is in the pot. If the plant is bareroot, plant with the crown of the plant (where the stems meet the roots) no more than one inch below the soil surface. Blooms late spring to early summer. Mature height 2 m (6 ft). Spreads 1.5 - 2 m (5 to 6 ft). Moderate growth rate. Remember that perennials (that are going to be work-horses for many years in your garden), often follow 3 unwritten rules: the first year they SLEEP; the second year they CREEP; the third year - they LEAP! Prune back heavier canes yearly. Fertilize 3 to 4 times a year with 10-52-17.

SHRUBS, TREES & FRUIT TREES

All "bare root" nursery stock (wrapped in cedar shavings) must be soaked for a minimum of 24 hours upon arrival.

Please "DO NOT" soak "seedling plugs" which are all-ready growing in soil, these should just be watered and transplanted directly into the garden.

Please make sure to read the plant label, it tells you how to handle it!

- Separate cedar packing material from roots and discard, it should not go into planting hole.
- Young trees need ample water to establish, generous waterings 2 times a week for the first two months, three if conditions are very dry.
- Always dig hole large enough so that roots are spread out evenly.
- Plant about 1-2 inches lower than old soil mark on tree or shrub.
- Never let exposed roots dry out in sun or wind.
- Apply light feeding of Fruit Tree and Shrub Fertilizer after initial planting, then every 2-3 weeks after that until late August.
- If you are unable to plant right away, make sure roots are soaking in water and in a cool place.
- On any grafted stock, make sure you cut off any suckers (branches from below graft) that start growing. These occur most often on Apple trees, plums and Roses.

PRUNING

Prune to get the desired shape and height or to check vigorous growth. On spring flowering shrubs, pruning should take place after flowering is completed. Non-flowering shrubs should be pruned during dormant period. On older shrubs it is advisable to cut back the older stems to ground level, while cutting the younger more vigorous stems to half their height. In the case of new shrubs, it is sometimes helpful to prune back the top third after planting, this gives the shrubs roots a better start as they have less to feed and thus can root quicker.

BREAKING DORMANCY

We store all our nursery stock in temperature controlled coolers right up until we ship. When you receive your stock it will just be starting to break dormancy. Soaking of stock is essential in getting the stock off to a good start. In some cases stock may be slow to leaf out. If this happens prune back tree or shrub by 1/3 and water heavily for 10 days. This will encourage stock to root and break dormancy.
